Practice Exam 1

Tables Provided on Exam 1

Table 1.5.1: Laws of propositional logic.

Idempotent laws:	$p \lor p \equiv p$	$p \land p \equiv p$
Associative laws:	$(p \lor q) \lor r \equiv p \lor (q \lor r)$	$(p \land q) \land r \equiv p \land (q \land r)$
Commutative laws:	$p \lor q \equiv q \lor p$	$p \land q \equiv q \land p$
Distributive laws:	$p \lor (q \land r) \equiv (p \lor q) \land (p \lor r)$	$p \land (q \lor r) \equiv (p \land q) \lor (p \land r)$
Identity laws:	$p \lor F \equiv p$	$p \land T \equiv p$
Domination laws:	$p \land F \equiv F$	$p \lor T \equiv T$
Double negation law:	$\neg\neg p \equiv p$	
Complement laws:	$p \land \neg p \equiv F$ $\neg T \equiv F$	$p \lor \neg p \equiv T$ $\neg F \equiv T$
De Morgan's laws:	$\neg(p \lor q) \equiv \neg p \land \neg q$	$\neg(p \land q) \equiv \neg p \lor \neg q$
Absorption laws:	$p \lor (p \land q) \equiv p$	$p \land (p \lor q) \equiv p$
Conditional identities:	$p \rightarrow q \equiv \neg p \lor q$	$p \leftrightarrow q \equiv (p \rightarrow q) \land (q \rightarrow p)$

Table 1.12.1: Rules of inference known to be valid arguments.

Rule of inference	Name
p $p \rightarrow q$ $\therefore q$	Modus ponens
$\neg q$ $p \rightarrow q$ $\therefore \neg p$	Modus tollens
p $\therefore p \lor q$	Addition
$p \land q$ $\therefore p$	Simplification

Rule of inference	Name
p q $\therefore p \land q$	Conjunction
$p \rightarrow q$ $q \rightarrow r$ $\therefore p \rightarrow r$	Hypothetical syllogism
$p \lor q$ $\neg p$ $\therefore q$	Disjunctive syllogism
$p \lor q$ $\neg p \lor r$ $\therefore q \lor r$	Resolution

Table 1.13.1: Rules of inference for quantified statements

Rule of Inference	Name
c is an element (arbitrary or particular) ∀x P(x) ∴ P(c)	Universal instantiation
c is an arbitrary element P(c) ∴ ∀x P(x)	Universal generalization
∃x P(x) ∴ (c is a particular element) ∧ P(c)	Existential instantiation*
c is an element (arbitrary or particular) P(c) ∴ ∃x P(x)	Existential generalization

Table 3.6.1: Set identities.

Name	Identities	
Idempotent laws	A ∪ A = A	A ∩ A = A
Associative laws	(A ∪ B) ∪ C = A ∪ (B ∪ C)	(A ∩ B) ∩ C = A ∩ (B ∩ C)
Commutative laws	A ∪ B = B ∪ A	A ∩ B = B ∩ A
Distributive laws	A ∪ (B ∩ C) = (A ∪ B) ∩ (A ∪ C)	A ∩ (B ∪ C) = (A ∩ B) ∪ (A ∩ C)
Identity laws	A ∪ ∅ = A	A ∩ U = A
Domination laws	A ∩ ∅ = ∅	A ∪ U = U
Double Complement law	$\overline{\overline{A}} = A$	
Complement laws	A ∩ $\overline{A}$ = ∅ $\overline{U}$ = ∅	A ∪ $\overline{A}$ = U $\overline{∅}$ = U
De Morgan's laws	$\overline{A ∪ B} = \overline{A} ∩ \overline{B}$	$\overline{A ∩ B} = \overline{A} ∪ \overline{B}$
Absorption laws	A ∪ (A ∩ B) = A	A ∩ (A ∪ B) = A

Set Theory

Given:

A = { 1, {2}, {{3, 4}} }
For each of the following statements, state whether they are **true** or **false**.

a. $1 \in A$
b. $1 \subseteq A$
c. $\{2\} \in A$
d. $\{2\} \subseteq A$
e. $\{3, 4\} \in A$
f. $\{3, 4\} \subseteq A$
g. $\{\{3,4\}\} \in A$
h. $\{\{3,4\}\} \subseteq A$
i. $\emptyset \in A$
j. $\emptyset \subseteq A$

Solutions:

a. T, the number 1 is an element of set A
b. F, the number 1 is not contained within a set of braces, thus is not a subset of A
c. T, the set containing 2 is an element of A (the number 2 is contained within a set of { } within A)
d. F, and would only be T if {{2}} was contained within A
e. F, because {3,4} would be need to contained within {{ }} rather than within just { }
f. F, because {{3,4}} would need to be an element contained within {{{ }}}
g. T, the set containing 3 & 4 ({3, 4}) is an element of set A
h. F
i. F, the empty set is always a subset and not an element of the larger set
j. T, the empty set is only a subset (always just a subset) of the larger set

1.2 Let A = {1, 2, 3, 4}. Select the statement that is **false**.
a. $\emptyset \in P(A)$
b. $\emptyset \subseteq P(A)$
c. $\{2, 3\} \in A$
d. $\{2, 3\} \subseteq A$

Solution:

C

Functions

Choose the property for which the function satisfies if well defined.

        a. Neither one-to-one, nor onto

        b. One-to-one, but not onto

        c. Onto, but not one-to-one

        d. one-to-one and onto

        e. not well defined

Given a function whose domain is the set of all integers and whose target is the set of all positive integers:

   a)

$$f(x) = 2x + 1$$

Solution: e

  b)

$$f(x) = |x| + 1$$

Solution: c

  c)

$$f(x) = x^2 + 1$$

Solution: a

  d)

$$f(x) = \{x > 0 : 2x + 1 \ \wedge \ x <= 0 : -2x\}$$
Solution: e

  e)

$$f(x) = x >= 0 : 2x + 1 \ \wedge \ x < 0 : -2x + 2$$

Solution: b

Proofs

4.1 Direct Proof
Prove that the product of two odd integers is an odd integer.

Proof.
Assume that integers m and n are odd integers. We will show that m*n is also an odd integer.

Integers m and n are odd integers
   $\Rightarrow$ m = 2k+1 for some integer k and n = 2j + 1 for some integer j
   $\Rightarrow$ m*n = (2k+1)(2j+1) for some integers k and j
   $\Rightarrow$ = 4kj + 2k + 2j + 1
   $\Rightarrow$ = 2(kj + k + j) + 1
Since j and k are both integers, then 2(kj + k + j) is also an integer. Since m*n can be expressed as 2 times an integer plus 1, m*n is an odd integer.

4.2 Proof by Contrapositive
Prove that if n^2 is even, then n is even.

Consider the contraposition of the proposition which is ~q→~p. Show that if n is odd, then n^2 is odd.

Proof.
Assume the hypothesis of the implication to be true.
Assume that *n* is an odd integer.
Show the implication.

n is an odd integer
   $\Rightarrow$ n = 2q+1 for some integer q
   $\Rightarrow n^2 = (2q + 1)^2$ for some integer q
   $\Rightarrow n^2 = 4q^2 + 4q + 1$ for some integer q
   $\Rightarrow n^2 = 2(2q^2 + 2q) + 1$ for some integer q and because q is an integer, then
    $(2q^2 + 2q)$ is also an integer,
   $\Rightarrow n^2 = 2j + 1$ for some integer j
Therefore n^2 is an odd integer that can be represented as 2j+1.

Having used a direct proof of the contrapositive statement, we can conclude that if n^2 is even, then n is even.

4.2 Proof by Contradiction
Prove by contradiction that if 3n+5 is odd, then n is even.

Proof.
Begin by assuming that 3n+5 is odd and n is *odd*.
Integer n is odd therefore n=2k+1 for some integer k.

substituting n=2k+1 for n in 3n+5,
3n+5 = 3(2k+1) + 5 for some integer k
      = 6k +8 for some integer k, algebra
      = 2(3k+4)
            Let k' = (3k+4) for some integer k,
            and since k is an integer, then k' = (3k+4) is also an integer.
      = 2(k')
Further, since k'= (3k+4) is an integer, and 2 multiplied by an integer is an even integer, by definition 3(2k+1) + 5 is even.

Thus, 3n+5 is even and because this **contradicts** the assumption that 3n+5 is odd then n is odd; we have proven that if 3n+5 is odd, then n is even.
Number Systems Conversion

5.1 Decimal to 8-bit Two's Complement

$(-43)_{10}$ = $(11010101)_{\text{8-bit Two's Complement}}$

5.2 Binary to Hexadecimal

$(110011100)_2$ = $(19C)_{16}$

Coding

Make a hollowed-out diamond made up of in-order alphabet letters. An example is below when <mark>n=5</mark>.

Solution:

```cpp
#include <iostream>
using namespace std;

int main(){
    int userInput = 7;
    char letter = 'a';
    char space = ' ';

    int outsideSpaceLimit = userInput - 1;
    int insideSpaceLimit = 0;

    for (int i = 1; i < (userInput * 2); i++) {
        // outside spaces
        for (int j = 0; j < outsideSpaceLimit; j++) {
            cout << space;
        }
        // first letter

        cout << letter;

        //inside spaces
        for (int j = 0; j < insideSpaceLimit; j++) {
            cout << space;
        }

        //second letter
        if (i != 1 && i != ((userInput * 2) -1)){
            cout << letter;
        }

        if(i < userInput){
            letter++;
            insideSpaceLimit += 2;
            outsideSpaceLimit--;
        }
```

```cpp
        else{
            letter--;
            insideSpaceLimit -= 2;
            outsideSpaceLimit++;
        }

        cout << endl;
    }

    return 0;
}
```

Challenge Question

For this question, you have to create the following Barn Door shape with n=10:

```
##########
#$      $#
# $    $ #
#  $  $  #
#   $$   #
#   $$   #
#  $  $  #
# $    $ #
#$      $#
##########
```

ONE answer (again, there are **many** ways to do this!):

```cpp
#include <iostream>
using namespace std;

int main(){
    int input;

    char frame = '#';
    char planks = '$';
    char space = ' ';

    cout << "Enter positive integer: ";
    cin >> input;

    for (int i = 0; i < input; i++) { //rows
        for (int j = 0; j < input; j++) {
            // left or right or top or bottom
            if (j == 0 || j == input - 1 || i == 0 || i == input - 1){
                cout << frame;
            }
            // left diagonal going right || right diagonal going left
            else if(i == j || i + j == input - 1){
                cout << planks;
            }
            else{
                cout << space;
            }

        }
        cout << endl;
    }
```

```
    return 0;
}
```
